Viri Foam is suitable for use in foam cups or spraying equipment.
It should be applied to udders and teats before milking.
Allow the product to act until the dirt is dissolved.
Then wipe the udder with a clean, damp milking cloth.
Always use a fresh, clean cloth for each animal.

pH:
pH In delivery state ~ 5,0

■ PROPERTIES

Viri Foam is used for cleaning and wiping of teats and udders before milking.

The primary objective of pre-milking udder and teat hygiene is to achieve an acceptable level of decontamination of teat skin. This aids in reducing the spread of microorganisms and in minimizing the number of bacteria that find their way into the raw milk supply, hereby improving overall milk quality.

Viri Foam is supplied as a "ready to use" solution, applied with spray bottle or in a foam cup. After application, wipe the udder with a clean cloth or udder paper.

Contains complex cleaning and caring ingredients. The ingredients are gentle to the teat skin.
